

GURPREET KAUR

Aspiring Data Analyst / Data Scientist

gunjan010908@gmail.com | +91 8130863925 | [linkedin.com/in/gurpreet-kaur-55100341a](https://www.linkedin.com/in/gurpreet-kaur-55100341a) | github.com/gunjan01-source

PROFILE SUMMARY

BCA student (Jamia Hamdard University, expected 2027) actively seeking a Data Analyst / Data Science internship. Built three end-to-end projects spanning SQL, Power BI, Tableau, and Python-based machine learning — from data cleaning and exploratory analysis through to model deployment. Comfortable working across the full analytics stack and eager to apply classroom learning to real business problems.

TECHNICAL SKILLS

Programming & Querying: Python (Pandas, NumPy, scikit-learn), SQL, Advanced Excel

Data Visualization & BI: Power BI, Tableau, Matplotlib, Seaborn, Dashboard Design

Databases: MySQL, MongoDB

Analysis & Modeling: Data Cleaning, EDA, Statistical Analysis, Regression, Classification, Random Forest, Feature Engineering

Tools & Deployment: Git/GitHub, Jupyter Notebook

PROJECTS

RideFare — AI-Powered Dynamic Pricing App

Python, Flask, Scikit-learn, Pandas, NumPy, Matplotlib | github.com/gunjan01-source/RideFare-AI-pricing-app

- Built an end-to-end ML web app predicting dynamic ride fares in real time from demand, driver availability, competitor pricing, distance, season, and customer ratings.
- Generated a synthetic 20,000-row dataset with realistic, non-trivial feature relationships; performed EDA and feature engineering, then trained and compared Linear Regression, Decision Tree, and Random Forest models.
- Selected Random Forest as the best performer (test $R^2 = 0.9941$, MAE = ₹7.70) after evaluating MAE, MSE, RMSE, and a train/test overfitting gap check with 5-fold cross-validation.
- Deployed the trained model with a Flask backend and an interactive HTML/CSS/JS frontend for live fare prediction; SHAP-based explainability and hyperparameter tuning identified as next steps.

Telecom Customer Churn Prediction

Python, Pandas, Scikit-learn, XGBoost, Matplotlib | github.com/gunjan01-source/telco-churn-prediction

- Analyzed 7,043 telecom customer records to identify drivers of churn, engineering features such as tenure segments and service-usage counts.
- Trained and compared six classification models (Logistic Regression, KNN, Naive Bayes, Decision Tree, Random Forest, XGBoost), tuning the decision threshold to prioritize recall over raw accuracy given the higher cost of missed churners.
- Found month-to-month contract customers churn 15x more often than two-year contract customers (42.7% vs 2.8%), among other key business insights.
- Selected Logistic Regression as the final model for its balance of precision and recall; serialized and validated the model for reproducible reloading.

Retail Sales Performance Analysis (Superstore)

Python, Pandas, NumPy, Matplotlib, MySQL, Power BI, Tableau | github.com/gunjan01-source/superstore-analysis

- Cleaned and analyzed 9,900+ retail orders using Python and Pandas, loaded the dataset into MySQL, and wrote SQL queries to surface category, region, and segment-level KPIs.
- Built a 2-page interactive Power BI dashboard with KPI cards, a conditionally-formatted Segment × Category profit matrix, region/segment slicers, a Discount-vs-Profit scatter plot, and an AI Key Influencers visual.
- Developed a parallel Tableau dashboard using calculated fields, table calculations (rank, percent of total), LOD expressions, and parameter-driven metric toggling.
- Identified Furniture as a systemic loss driver — negative profit across every customer segment despite solid sales volume — and found discounts above 40% consistently turned orders unprofitable.

CERTIFICATIONS

Data Science Certification — IICS (In Progress)

EDUCATION

Bachelor of Computer Applications (BCA)

Jamia Hamdard University | Expected Graduation: 2027
